Masked Supervised Learning for Semantic Segmentation

Hasib Zunair and A. Ben Hamza

Motivation

- Existing semantic segmentation methods overly focus on attention-based methods to model long-range context.
- Does not explicitly leverage context (self-supervised masked autoencoders, two stage training)
- We ask:
 - Is short range useful?
 - Does it work well with attention-based methods?

Failure Cases

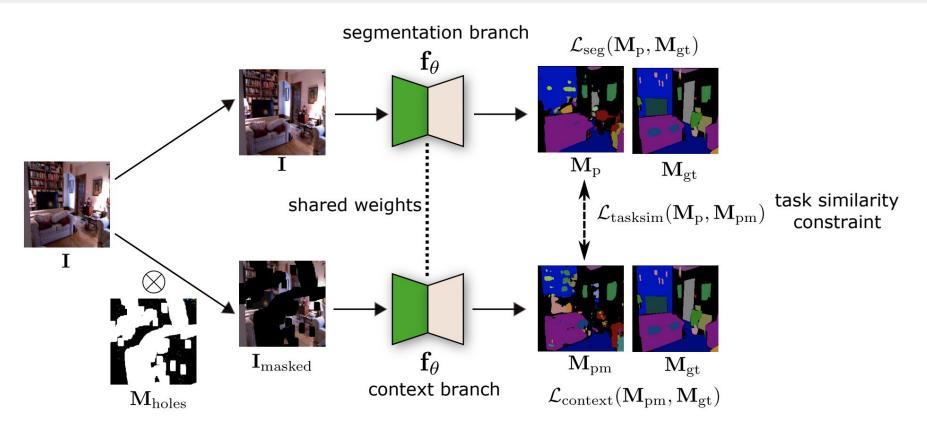

- Over-segment regions of interest (ROIs)
- Noisy and discontinuous predictions
- Fail to predict boundary regions
- Poorly segment minority classes & misclassify in multi-class semantic segmentation

These failure cases lead to poor segmentation performance.

Masked Supervised Learning for Semantic Segmentation

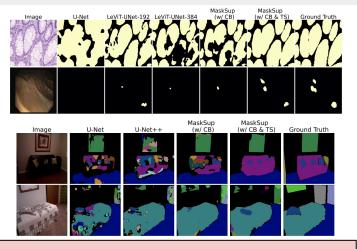

Hasib Zunair and A. Ben Hamza

 $\mathcal{L}_{total} = \alpha_1 \mathcal{L}_{seg}(\mathbf{M}_p, \mathbf{M}_{gt}) + \alpha_2 \mathcal{L}_{context}(\mathbf{M}_{pm}, \mathbf{M}_{gt}) + \alpha_3 \mathcal{L}_{tasksim}(\mathbf{M}_p, \mathbf{M}_{pm})$

Masked Supervised Learning for Semantic Segmentation

Hasib Zunair and A. Ben Hamza

MaskSup can better i) segment both natural and medical images, ii) model shape of small ROI iii) segment minority classes

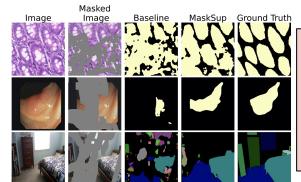

| Method | GLaS, mIoU (†) | CVC-Clinic-DB, mIoU (†) | NYUDv2 (†) |

| Low | 75.65 | 81.80 | 35.33 |
| High | 76.06 | 84.02 | 39.31 |

Heavy masking works better in MaskSup!

MaskSup can segment regions even when input is heavily masked (shape aware)

Segments **small** ROIs (short-range context)

Segments **large** ROIs (long-range context)

| Method | Params (M) (\downarrow) | GLaS, mIoU (†) | CVC-Clinic-DB, mIoU (†) | NYUDv2 (†) |
|---------------------------------------|---------------------------|-------------------------------|-------------------------------|------------------------------|
| LeViT-384 [29] MaskSup (LeViT-192) | 51 19 (2.6x) | 73.88 74.44 (+0.75) | 81.38 82.17 (+0.97) | - |
| U-Net++ [E] MaskSup (U-Net) | 9 3 (3x) | - | - | 34.74 38.54(+10.91 |

MaskSup is computationally efficient and achieves superior performance with fewer parameters.
